Femtometer™
Few Cycle Pulse Characterization

Femtometer is a Michelson interferometer-based autocorrelator, combined with high quality computerized data acquisition, processing and evaluation software, developed for ultrashort pulse characterization. It consists of a compact interferometer head, a spectrometer and a controller interface. Femtometer is the only computerized pulse characterization tool that provides access to the time scale of the light oscillation period allowing the measurements of few-cycle pulses.

Efficient
Combining data in the time and frequency domain allows efficient characterization, evaluation and documentation of the laser pulses. With the new compact design, Femtometer requires minimal space since it can be positioned either horizontally or vertically.

Ultrafast and Versatile
The Femtometer dispersion compensated design offers high fidelity pulse measurement down to 5 fs. It offers flexibility due to the removable detection modules, allowing the characterization of ultrafast oscillators using the MHz detector. Operation as a plain Michelson interferometer is also possible. Combined with a laptop computer (not included) for data acquisition, Femtometer yields a portable characterization tool offering several data export options.

The Femtometer Advantage

- Ultrashort pulse characterization
- MHz characterization
- Power monitoring
- Evaluation of pulse duration

Applications
- Interferometric autocorrelation
- Background free autocorrelation
- Coherence function measurement
- Spectral characterization
- Microscopy
**Femtometer**

**Digital Storing Oscilloscope**

The oscilloscope software module, designed to display the autocorrelation trace, offers a large display and all necessary settings for efficient, easy handling.

**Spectrometer Module**

The spectrometer software module shows the laser spectrum, including center wavelength and FWHM bandwidth.

**Online Evaluation**

Standard features are calculations of center wavelength, spectral width and pulse duration. The system is self-calibrating, based on the speed of light.
